## DIRECT DRIVE CATALOGUE

Designed with the aim of addressing new industrial needs, **ALXION** has created ST low inertia motors range for **DIRECT DRIVE** allowing acceleration up to 20 000 rad/s<sup>2</sup>. ST range is proposed in three diameters, 145, 190 and 300 mm with a variety of hollow shafts up to internal diameter 75 mm, blind shafts or solid shafts.

Rated torques cover a wide range between 14.6 Nm and 261 Nm in natural convection, and the peak torque covers from 55 Nm up to 1161 Nm. The motors can reach a rated speed from 200 rpm up to 1500 rpm according to the windings and allow a high regularity of rotation at low speed.

Those motors present an outstanding compacity with a continuous torque-to-weight up to 3.7 Nm/Kg and a peak torque-to-weight up to 18 Nm/Kg.

Their design allows the integration of a high variety of resolvers or encoders.

Based on the need for a maximal accuracy of the servomechanism, the resolvers developed by **ALXION** are adapted to the Motors for Direct Drive of its ST Range and can be used advantageously in axis using STK motors. They represent a further necessary step towards the exploitation of the direct drive technology.

Thanks to its long experience in Direct Driving, **ALXION** has developed its products portfolio with a range of **DIRECT DRIVE** frameless motors.

Complementary to its ST range, those motors in kits (armature + rotor) are designed to be integrated inside machines which require very high hollow shaft diameter as well as accuracy and speed regularity.

STK frameless motors range presents outstanding rated torques from 15Nm up to 2708 Nm in natural convection and can reach 6100 Nm by using fluid cooling.

The peak torque can be 4 times higher than the rated one (up to 11310Nm).

The high hollow shaft diameter allows internal clearance between 56 mm and 630 mm.

**ALXION** has made a complete technical documentation and ensures an appropriate technical support for allowing a close collaboration with the users starting from the machine design.

Those motors can be controlled with all types of drives dedicated to Brushless sinusoidal control servo system.

Those **ALXION DIRECT DRIVE** ranges have been designed and industrialised with the aim to ensure excellent dynamics and accuracy and highest reliability as well as acceptable costs for the users.

**DIRECT DRIVE IS MORE THAN AN IDEA**

# ST MOTORS RANGE :

## HIGH TORQUE-TO-WEIGHT PM MOTOR WITH LOW INERTIA FOR DIRECT DRIVE

Designed with the aim of addressing new industrial needs, **ALXION** has created **ST** low inertia motors range for **DIRECT DRIVE** allowing acceleration up to 20 000 rad/s<sup>2</sup>. Proposed in three diameters, 145, 190 and 300 mm with a large variety of position feedback: resolvers, encoders and a variety of shafts: hollow, blind or solid shaft. Rated torques cover a wide range between 14.6 Nm and 235 N.m, in natural convection, and the peak torque covers from 55 Nm to 1161 Nm. The motors can reach a rated speed up to 1500 rpm.

These motors present an outstanding compacity with a continuous torque-to-weight up to 3.7 Nm/Kg and a peak torque-to-weight up to 18 Nm/Kg.

Two windings are proposed as a standard: 500 and 1500 rpm for 145ST, 500 and 1000 rpm for 190ST and 200 and 800 rpm for 300ST. But the winding can easily be adapted to match your optimum drive rating.

### MAIN CHARACTERISTICS

Integration of a SCS KIT 101 encoder inside a hollow shaft 145ST

Windings (standard)	145 ST	190 ST	300 ST
Continuous torque ( N.m )	500 and 1500 rpm	500 and 1000 rpm	200 and 800 rpm
Peak torque ( N.m )	Up to 47.4	Up to 111	Up to 261
Hollow shaft diameter ( mm )	Up to Ø 60	Up to Ø 75	Up to Ø 72
Motor technology	HP or SP		
		.Resolver accuracy ±1 arc min .SinCos encoders : incremental or with commutation track .ENDAT absolute encoders .HIPERFACE® encoders .Resolver accuracy ±10 arc min	
Position feedback			
Power and signal connections :	Class 6 cables 2 meters length		Circular connectors
Protection degree	IP 54		
Humidity	< 85% (not condensing)		

Motor technology :

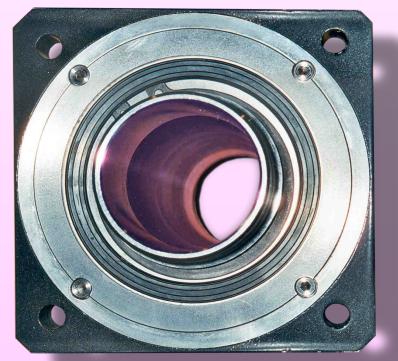

SP: Standard precision technology ; cogging ≤2% of rated torque

HP: High precision technology ; cogging <1% of rated torque

X : High precision technology ; cogging <2% of rated torque

### ASSETS:

- High dynamics
- No gear
- No backlash
- High accuracy servo
- Elimination of maintenance
- Simplification of servomechanism
- Noise reduction
- Machine optimisation and simplification

## **14ST MOTORS**

Continuous torque : from 8 N.m up to 47.4 N.m  
Peak torque : from 27.5 N.m up to 220 N.m  
Hollow shaft : up to 60 mm  
Rated speed : from 500 rpm up to 1500 rpm

Resolvers table

	Number of poles	Rated supply voltage (V)	Transformation ratio	Input impedance $Z_{Ro}$	Output impedance $Z_{Ss}$	Mechanical accuracy (arc min)	Phase shift (°)
Resolver #1	12	7	0.23	77 + j177	118 + j258	$\pm 1$	7
Resolver #6	2	7	0.5	105 + j215	155 + j200	$\pm 10$	4

## THERMAL SENSORS

Our motors are equipped with two kinds of thermal sensors for winding temperature survey :

- Linear winding temperature by means of linear resistor KTY 84 : 575 Ohm at  $20^\circ\text{C}$  ; 1000 Ohm at  $100^\circ\text{C}$ .
- Winding thermal security by means of PTC resistor : ohmic value lower than 100 Ohm for acceptable temperature ; ohmic value higher than 1300 Ohm from  $160^\circ\text{C}$  threshold (maximum acceptable winding temperature)

The thermal sensors are connected to the feedback position cable for motors 145 & 190ST and to signal connector for motors 300ST.

## MOTOR TECHNOLOGY

- H : High precision technology for motor 145 & 190 ST, cogging  $<1\%$
- S : Standard precision technology for motor 145 & 190 ST, cogging  $\leq 2\%$
- X : High precision technology for motor 300 ST, cogging  $<2\%$

# ***RESOLVERS RES FC RANGE :***

Based on the need for a maximal accuracy of the servomechanism, the resolvers developed by **ALXION** are adapted to the Motors for Direct Drive of its ST Range and can be used advantageously in axis using STK motors. They represent a further necessary step towards the exploitation of the direct drive technology.

The high accuracy resolvers with high internal hollow shaft diameter **ALXION** RES FC have been especially designed for **ALXION** Direct Drive motors. Three versions are available in 2 and 12 poles executions :

## **TECHNICAL CHARACTERISTICS**

### **RES FC 1-72-32-90 :**

- Type : transmitter 2 poles
- Frequency : 10 kHz
- Rated supplied voltage : 7 V
- Transformation ratio : 0.25
- Input impedance :  $Z_{ro} = 24 + j 233$
- Output impedance :  $Z_{ss} = 478 + j 1031$
- Accuracy : +/- 50 arc min
- Noise at null coupling : < 3/1000
- Phase shift : 1°
- Inner diameter : 90 mm

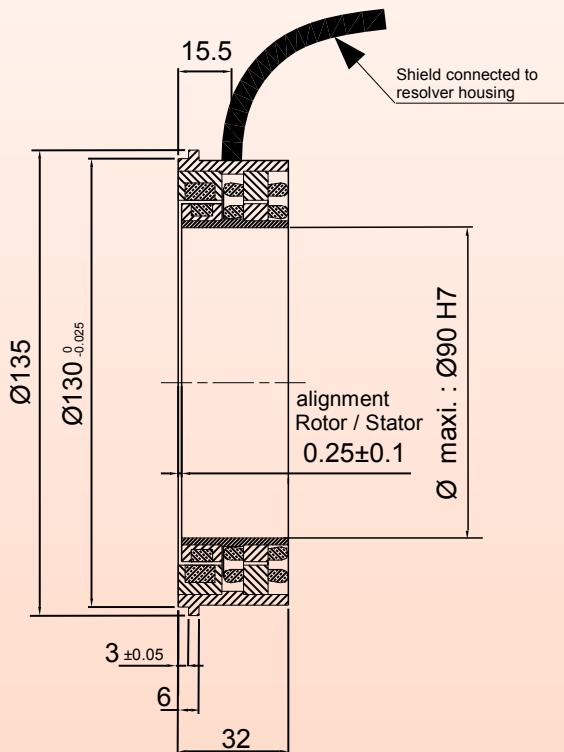

### **RES FC 6-72-32-90 :**

- Type : transmitter 12 poles
- Frequency : 10 kHz
- Rated supplied voltage : 7 V
- Transformation ratio : 0.23
- Input impedance :  $Z_{ro} = 77 + j 177$
- Output impedance :  $Z_{ss} = 118 + j 258$
- Accuracy : +/- 1 arc min
- Noise at null coupling : < 3/1000
- Phase shift : 7°
- Inner diameter : 90 mm

### **RES FC 6-72-32-90-50 :**

- Type : transmitter 12 poles
- Frequency : 10 kHz
- Rated supplied voltage : 7 V
- Transformation ratio : 0.5
- Input impedance :  $Z_{ro} = 77 + j 177$
- Output impedance :  $Z_{ss} = 396 + j 869$
- Accuracy : +/- 1 arc min
- Noise at null coupling : < 3/1000
- Phase shift : 7°
- Inner diameter : 90 mm

**FRAMELESS BRUSHLESS  
MOTORS  
FOR DIRECT DRIVE  
ALXION STK**

## **FRAMELESS BRUSHLESS SERVOMOTORS FOR DIRECT DRIVE**

### **MAIN CHARACTERISTICS:**

- Continuous torque from 14.6 Nm up to 2708 Nm in natural convection and up to 6100Nm in fluid cooling depending on the size.
- Six external diameters from 145 mm up to 800 mm.
- Internal diameter from 56 mm up to 630 mm.
- Various available windings from 30 rpm up to 1500 rpm depending on the size.

The range of permanent magnets brushless motors **ALXION** STK has been specially designed for the direct drive of axis without gears needing very low volume and weight regarding the torques and powers to be developed.

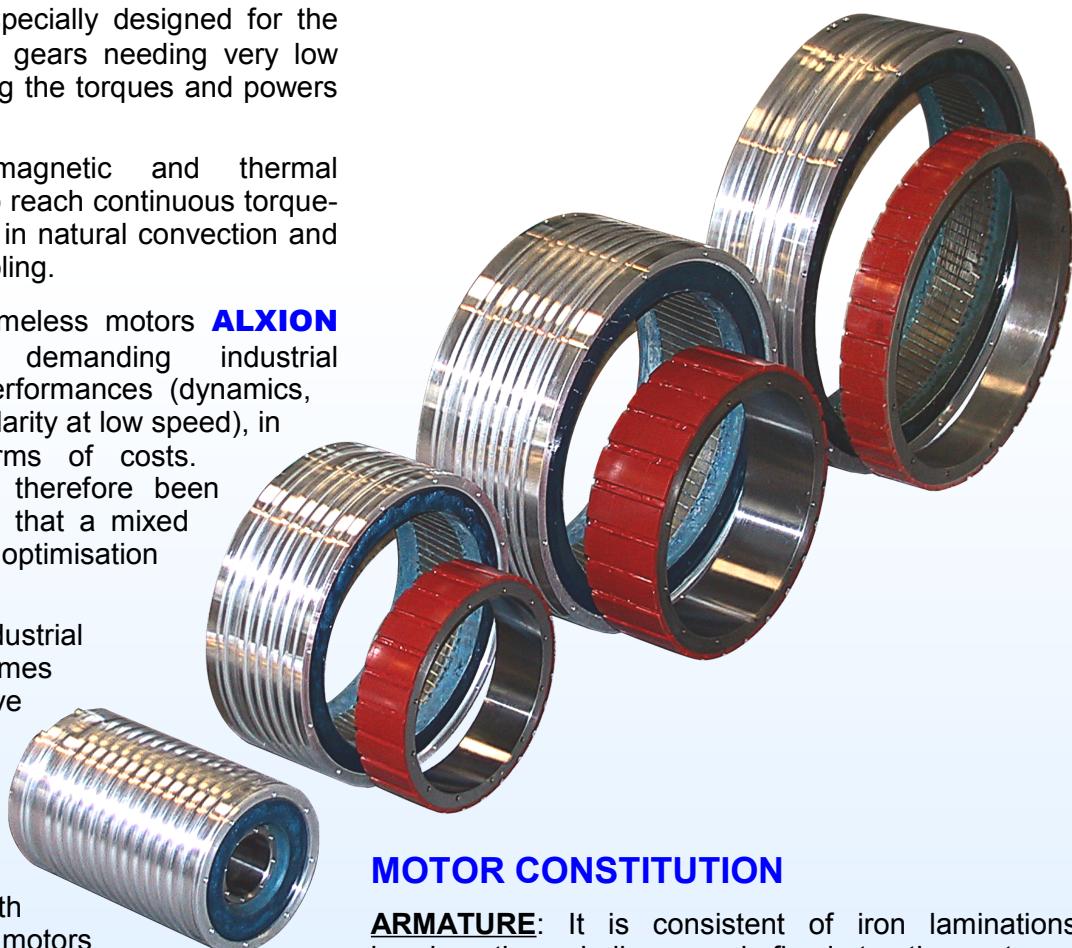

Therefore, both electromagnetic and thermal optimisation have allowed to reach continuous torque-to-weight up to 15 Nm / Kg in natural convection and up to 30 Nm / Kg in fluid cooling.

However, the range of frameless motors **ALXION** STK addresses very demanding industrial applications in terms of performances (dynamics, compacity, accuracy in regularity at low speed), in reliability but also in terms of costs. A particular attention has therefore been dedicated in the design so that a mixed technical and economical optimisation could be achieved.

On another hand, the industrial users can be sometimes unsatisfied by direct drive motors because they are generally torque motors getting therefore a reduced power and speed.

**ALXION** got the ambition to answer that objection with the STK range by creating motors that could satisfy the low speed applications with their related speed regularity and also to address the direct drive applications up to 30 KW in natural convection and 100 KW in fluid-cooling with speed reaching up to 1500 rpm, depending on the size.

The various speeds can be reached thanks to several windings versions. Some of them are illustrated in that catalogue but numerous winding versions allowing to optimise the drive current rating can be easily achieved.

### **MOTOR CONSTITUTION**

**ARMATURE:** It is consistent of iron laminations bearing the windings and fixed to the external housing. The windings are encapsulated in resin. Housing is either smooth either grinded for bearing the engravement of the cooling circuit when it is requested.

- Winding in H class.
- Output cable class 6 with 4 shielded wires for the power.
- Thermal protection by PTC resistor and linear resistor KTY84 embedded in the winding.
- Output cable class 6 with 2 shielded pairs.

**ROTOR:** Rare earth magnets protected against corrosion are stuck around a magnetic iron ring.

For all detailed specifications related to integration and environment, please ask for our « handbooks for integration »

## STATOR AND ROTOR MOUNTING

Optionally STK armatures and rotors can be shipped mounted on a centering and positioning flange for avoiding the user to make the operation of mounting and centering the rotor inside the stator.

## OPERATION IN NATURAL CONVECTION

The armature is the source of both current losses and hysteretic and eddy current losses. It will be necessary to take it into account for integrating the motor. Here are the main elements to be taken in consideration:

- Permanent torques of the motors are indicated for a copper temperature rise of 120°C for armatures in contact with ambient air or integral on all their peripheral area with a metallic part in contact with ambient air. In addition, the motor housing has to be fixed on a metallic flange with an area equal to at least twice its section.

For example, for a 400 mm diameter motor, the flange will have an area equal to:  $2 \cdot \frac{\pi \cdot 0.4^2}{4}$  i.e.  $0.25m^2$

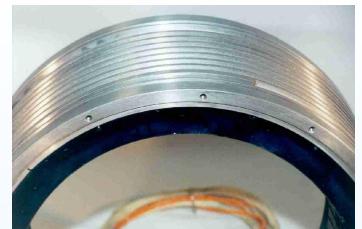

- Avoid any enclosed environment or if it is necessary consult us for knowing the motor derating.
- Be sure that the materials located in the motor vicinity can bear high temperatures or if it is not the case consult us for knowing the motor derating.

## FLUID COOLING

For avoiding to be dependent from environment problems related to overheating or in the case when continuous torques higher than those got in natural convection are needed, a fluid cooling will be used.

Two operating points are characterised in fluid cooling:

- Winding at 60°C.
- Maximum cooling (winding at 140°C) for getting the maximum continuous torque of the motor.

Use glycolated softened water or a fluid approved for closed cooling circuit in order to minimise the risks of corrosion and deposits.

The housing engravement is consistent of 2 extremity grooves for O - ring, then two circular grooves allowing the input and the output of the fluid separated by the cooling circuit.

When mounting the device, the input and output pipes will be axially aligned at the opposite of the input and the output of the cooling circuit.

## DRIVES AND ASSOCIATED POSITION SENSORS

The frameless motors **ALXION** STK have been designed for minimising the torque harmonics when they are fed by sinusoidal wave drives for brushless motors.

The STK motors are therefore compatible with a wide spectrum of brushless drives available on the market and namely with the ranges of single axis digital drives MOOG, DBS and DS 2000 and multiaxis DBM, SIEMENS 611D with AN power supply, NUM Schneider MDLU, Parker COMPAX, GE FANUC, CONTROL-TECHNIQUES UNIDRIVE, B & R, DANAHER Servostar 600, ...

However, in the aim of maximising the servo performances, we do recommend to use drives including the following features:

- Digital current loop with programmable gains or self adaptative gains.
- Built-in anti-resonant programmable filters on the speed error in order to maintain high servo gains in the case when the load inertia is very high related to the rotor inertia.

· Various positioning sensor interfaces: the drives can be compatible with 4 kinds of positioning interfaces:

- Resolver:

The resolvers are in the best cases (**ALXION** resolver RES FC6 72 32) limited to an accuracy of 1 arc minute. In most of the resolvers available on the market, accuracy is rather around several minutes.

It will be necessary to check whether the desired positioning accuracy is compatible with the resolver accuracy and also the electronic resolver-to-digital circuit.

On another hand, the resolvers limit the applications due to the crossing hollow shaft. The resolvers **ALXION** RES FC6 72 32 allow a hollow shaft up to 90 mm.

Finally, the resolvers allow to get a resolution up to several hundred thousands of points per revolution but such a high resolution is not useful because it is not compatible with the accuracy of the measurement system.

- TTL encoder or TTL optical scale:

The TTL encoders have generally a limited number of cpr (from 500 up to 5000). One can find some encoders with hollow shaft up to 50 mm internal diameter and with a number of cpr between 15000 and 20000 (to be multiplied by 4).

The best solution in terms of resolution and accuracy consists in the optical scales with pitches from 0.5 to 5  $\mu$  that can be stuck on a hollow hub with appropriate diameter. They can allow a resolution equal to 1 million cpr or much more according to the diameter.

The associated read heads are characterised by a maximum frequency limiting so the speed for a given resolution.

- Sin / cos encoder or sin /cos scales:

These encoders or scales are the most widely used.

The same limitations as previously mentioned exist on these devices. However, the advantage of this technology consists in the possibility to multiply the sine wave signals of these encoders thanks to appropriate drive interfaces. Thus, an encoder with 1024 sine waves per resolution will allow with multiplication per 1000 to get one million cpr. The sin / cos optical scale gets the advantage to allow both high resolution either naturally either by internal drive interpolation and a crossing hollow shaft without any limitation thanks to its sticking on an appropriate diameter hub. Some encoder suppliers integrate in their catalogue optical scales mounted on hubs with various diameters. Some bearing manufacturers integrate sine wave measuring scales in the bearings.

- Absolute encoders:

The absolute encoders allow to get the characteristics described for the TTL or Sin-Cos encoders without the need of starting sequence for phase commutation (see following paragraph). They do not need a homing phase for the axis origin.

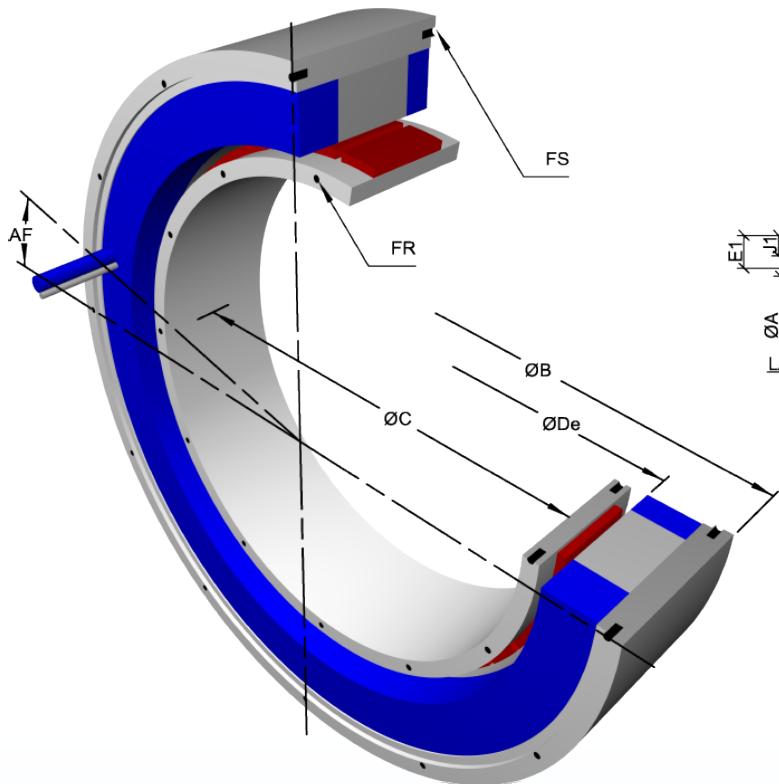

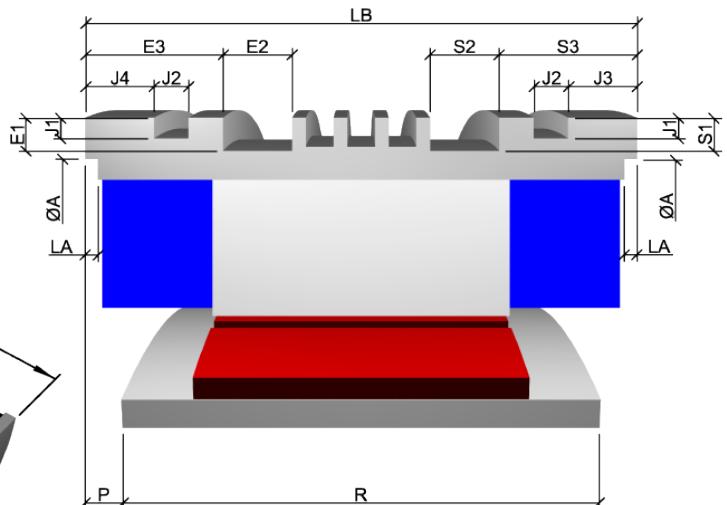

## PHASES COMMUTATION

The permanent magnets synchronous motors need a constant phase between the armature and the rotor rotating fields in order to control the torque. The resolver allows this phasing and gives simultaneously the axis position (on one polar pitch). The absolute encoders allow also that phasing. It is not the case with incremental encoders or scales.

The encoder suppliers have therefore specific ranges for brushless motors including either:

- a) Three phase commutation rectangular signals  $U$ ,  $V$ ,  $W$ ,  $\bar{U}$ ,  $\bar{V}$ ,  $\bar{W}$  in the case of TTL encoders ; but these waveforms should have the same number of periods per revolution than the motor (polarity).
- b) Sine waves signals (1 period per revolution) sine and cosine giving the absolute position on a revolution in the case of sin / cos encoders. The drive electronic interface multiplies that frequency by the number of the motor pole pairs.

In the case of optical scales mounted on hubs, the information related to the phasing between the armature and the rotor fields is not known. Therefore an initialisation sequence is needed during start-up ; during that sequence the rotor will operate an indexing motion or at least a microvibration.

*Natural convection**Fluid cooling***DIMENSIONS FOR ALL 145 STK**

**INTEGRATION:**

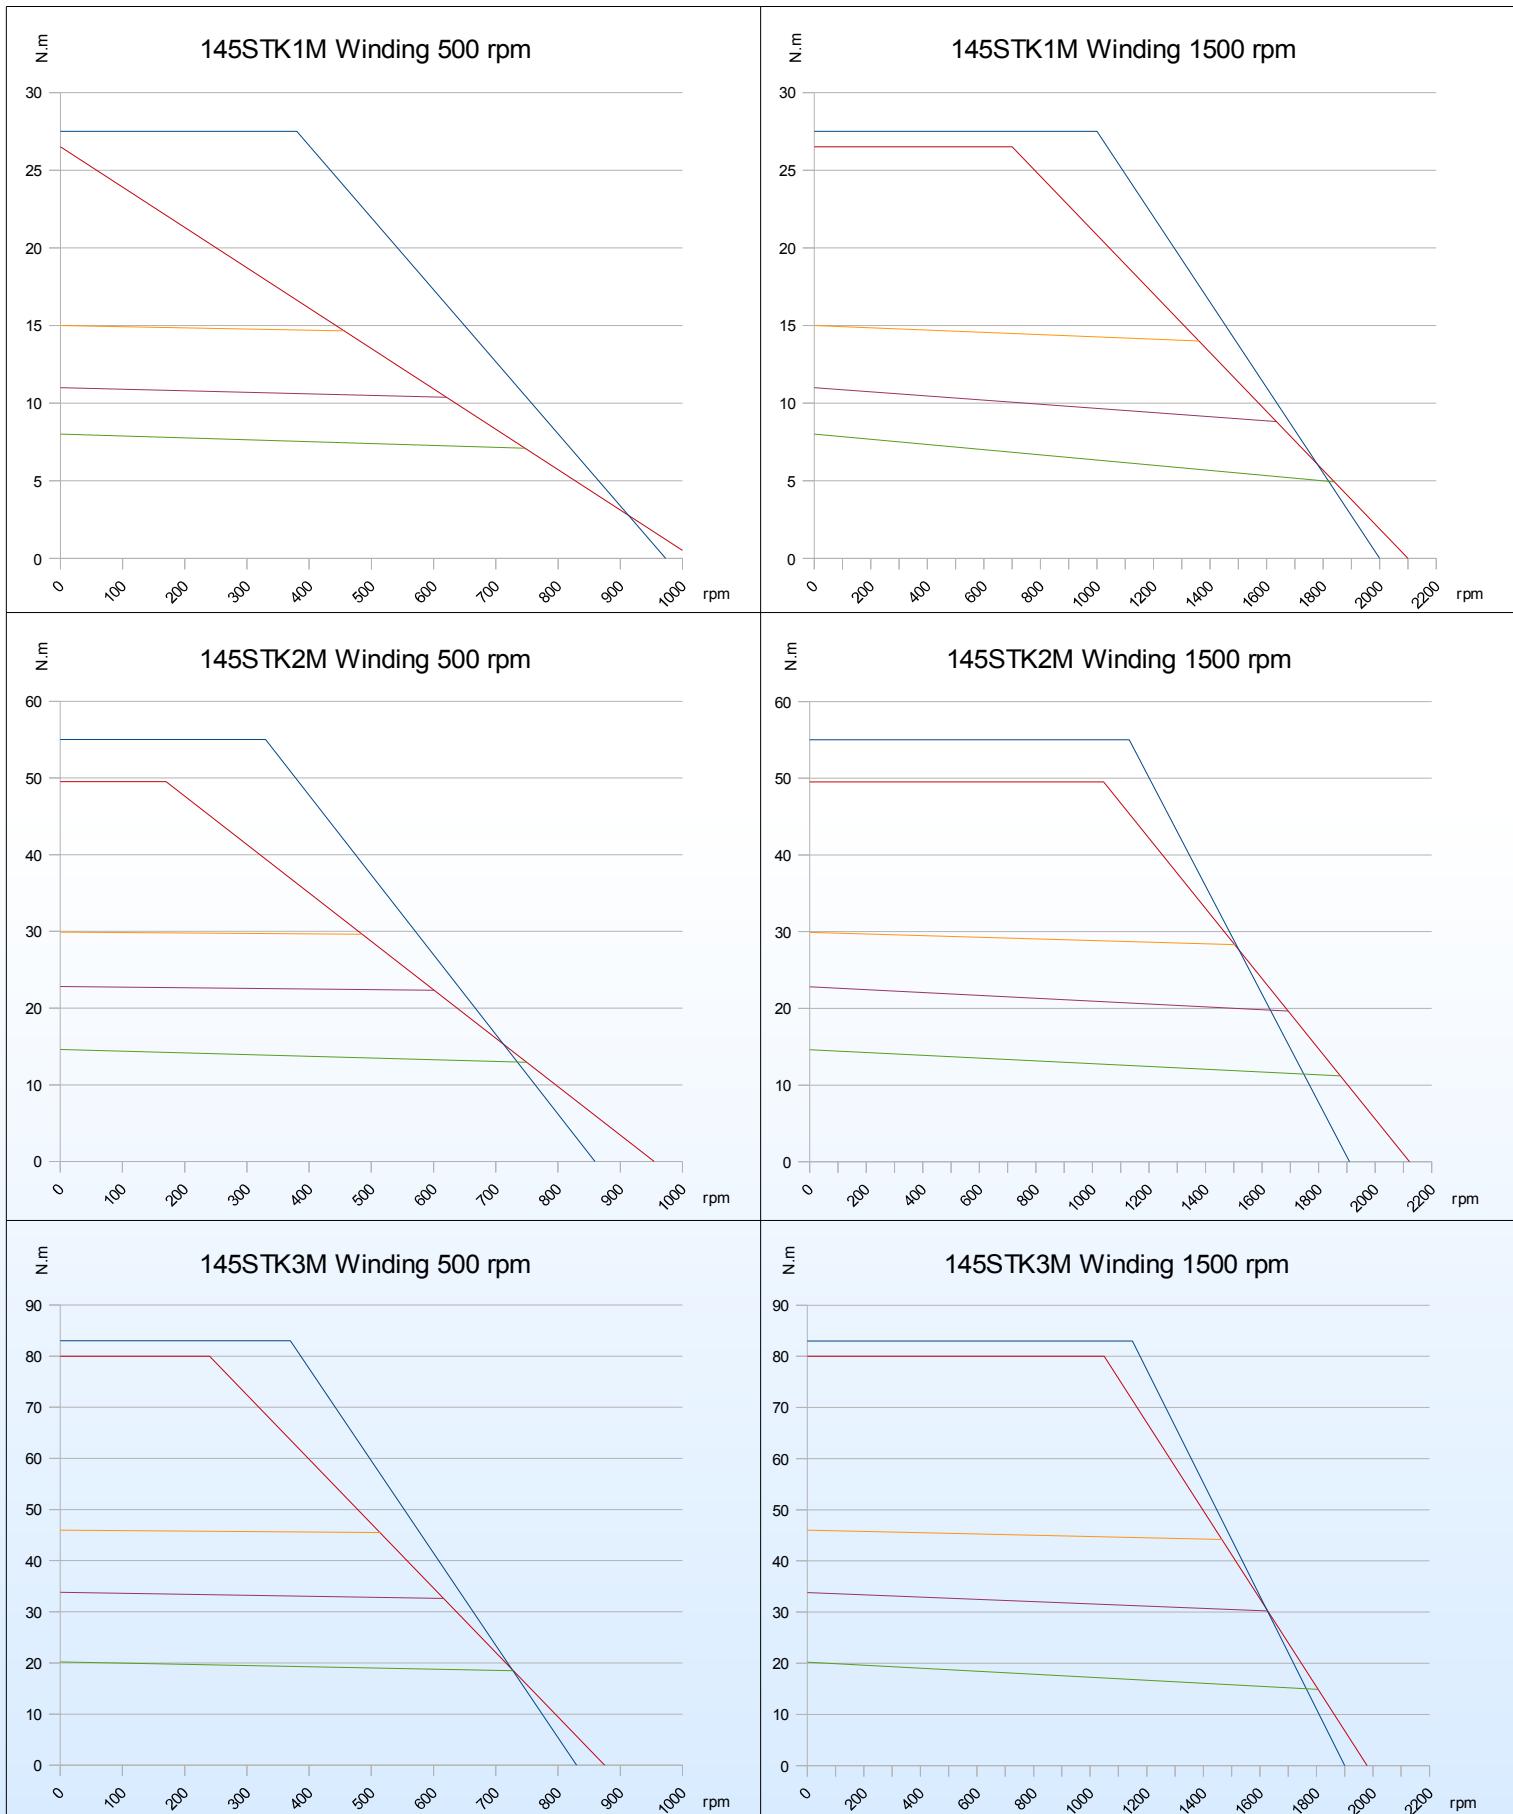

- ✓ The cables are made of PU, class 6, foreseen for cable-bearing chains, 2 mt standard length, copper square section according rated current.
- ✓ Rotor / housing alignment (P) has to be executed within +/- 0.1 mm. Optionally, we can supply a mounting tool for achieving that alignment in case of assembly without possibility of accurate alignment.
- ✓ Thermal devices cable consists of 2 shielded pairs 2x2x0.25mm<sup>2</sup> section, 7 mm max external diameter.
- ✓ (De) represents:
  - 1- The maximum diameter passing inside the housing.
  - 2- The minimum diameter necessary for rotor assembly.
- ✓ (Pmax) diameter for pieces in contact with the rotor must never be exceeded.
- ✓ Tapped holes on each side of rotor and housing are angularly aligned.
- ✓ Cable positioning (AF) is theoretical. Leave a free room with a +/- 10 arc degrees tolerance around that position, on a 50 mm height from the housing side, for avoiding to stress the cables at the motor output.
- Do not tighten, twist or bend the power cable on the first 50 mm from motor side. Clamp the cable after those 50 mm.
- ✓ When designing the assembly, take care to insure a perfect contact between housing and user's bore for avoiding thermal problems.
- ✓ For housing mounting, use either external centering diameter (B) or internal centering diameters (A).
- ✓ For execution tolerances (perpendicularity, concentricity...), please consult us.
- ✓ Fluid input and output pipes have to be placed at the opposite of wire outputs on the same axial plane.
- ✓ O-ring grooves designed for 3 mm diameter o-rings.

(1) Thermal conditions:

Ambient temperature 20°C

Winding temperature rise 120°C

Stator housing in contact with the ambient air or integral on all its peripheral area with a metallic armature in contact with the ambient air.

Stator housing secured on a metallic frame having an area equal to twice the cross section of the housing.

(2) Cold motor at 20°C

(3) See torque vs speed characteristics on :

<http://www.alxion.com/>

(4) Torque at stall or low speed.

(5) Fluid input temperature should not be lower for avoiding condensation inside the motor.

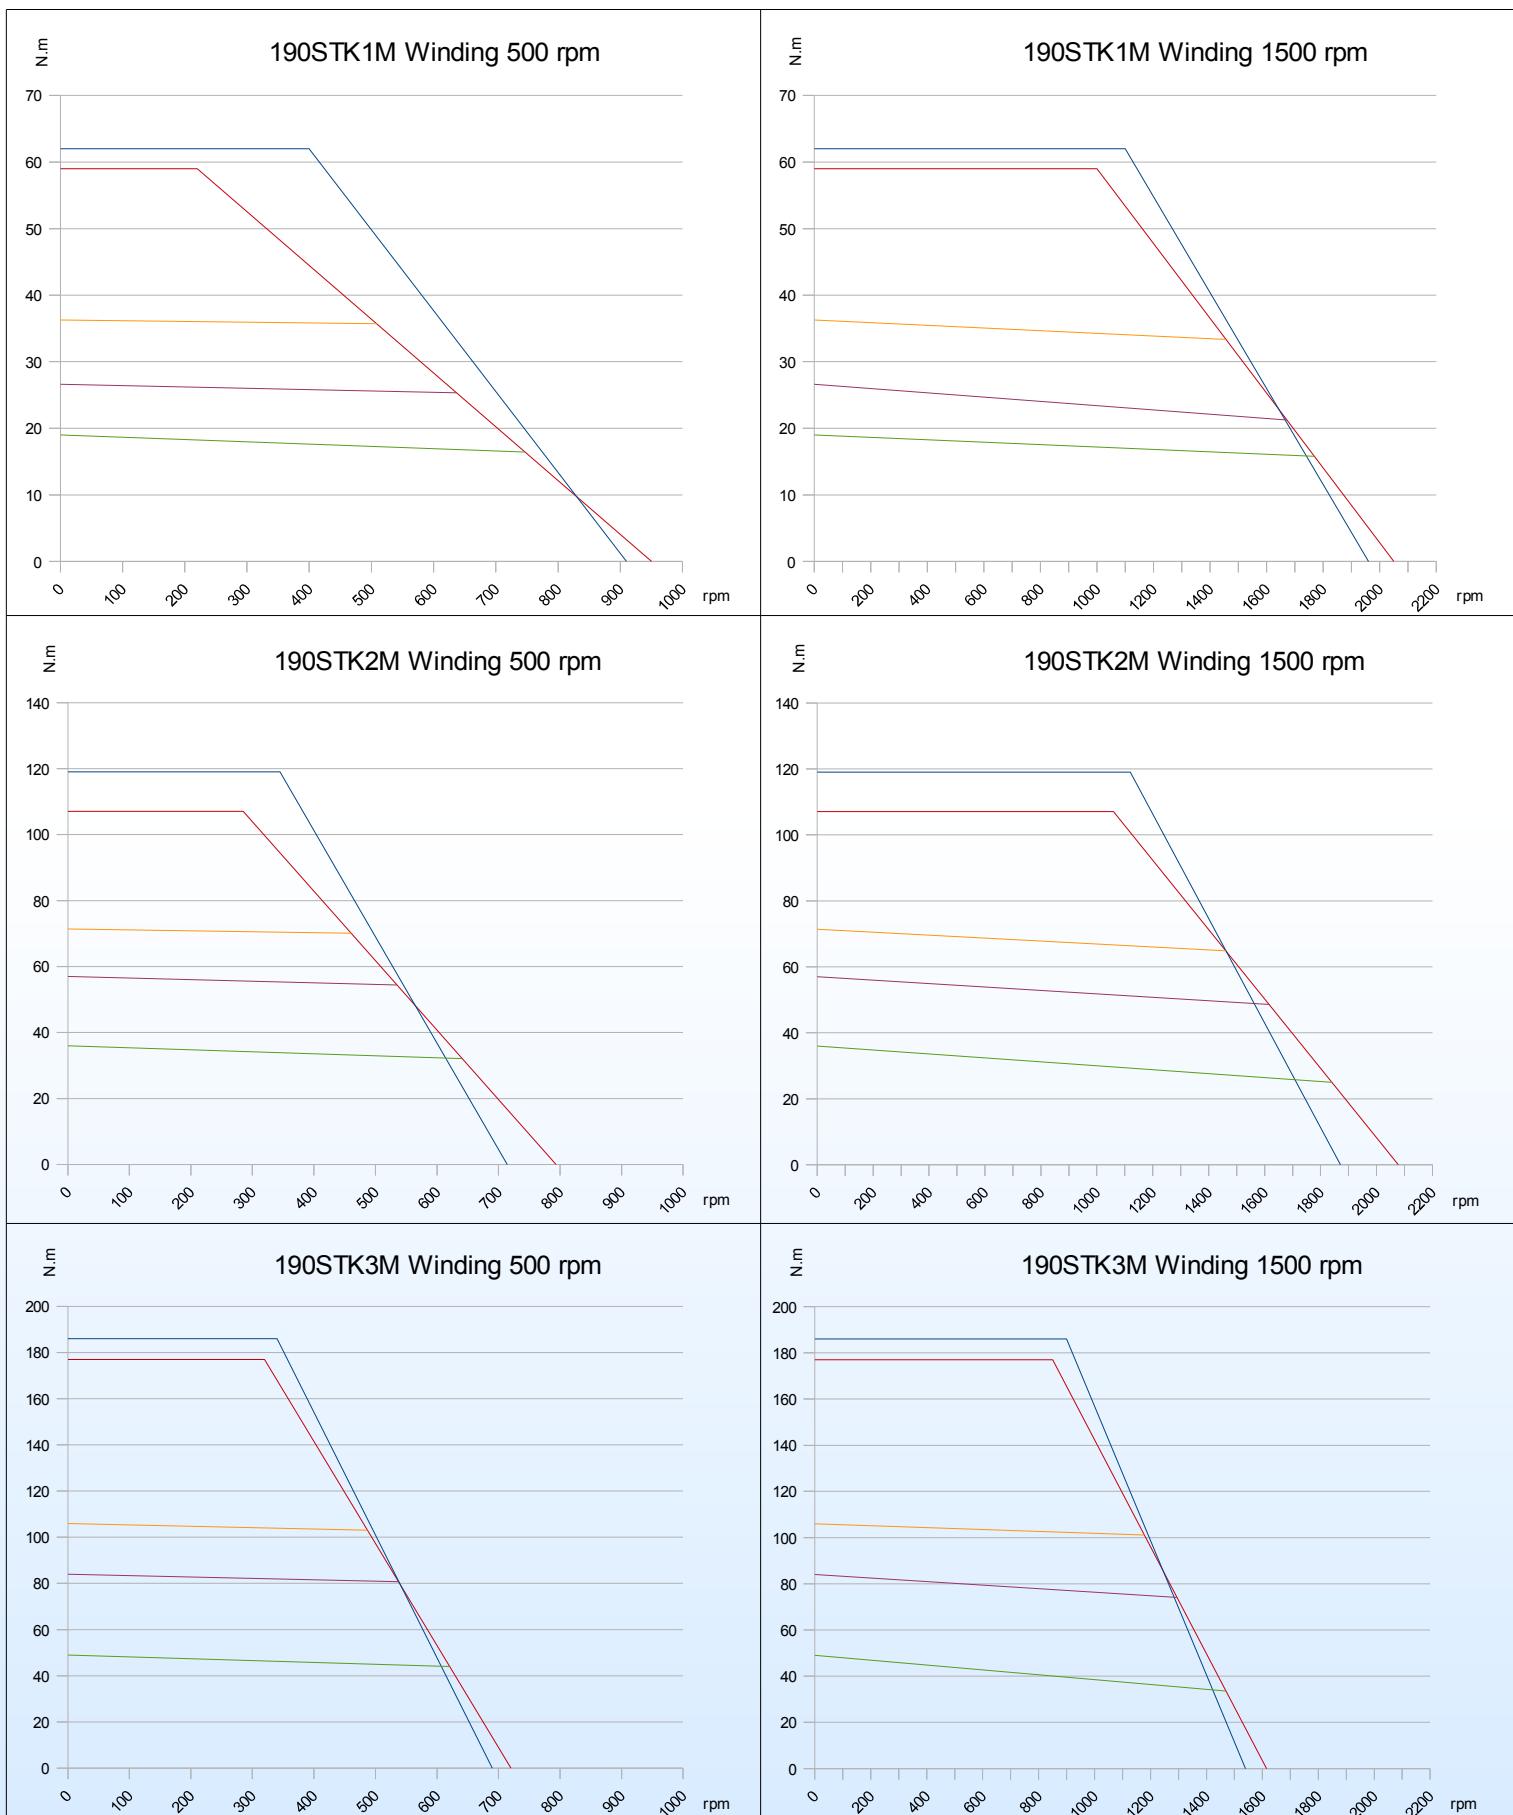

(6) For cooling fluid, use softened glycol-added water or fluids approved for closed cooling circuits.

(7) For currents lower than 53 Amps, one shielded cable

For currents over 53 Amps, four single shielded wires output (highlighted in the table)

Other speed characteristics are available, please contact us.

(1) Thermal conditions:

Ambient temperature 20°C

Winding temperature rise 120°C

Stator housing in contact with the ambient air or integral on all its peripheral area with a metallic armature in contact with the ambient air.

Stator housing secured on a metallic frame having an area equal to twice the cross section of the housing.

(2) Cold motor at 20°C

(3) See torque vs speed characteristics on :

<http://www.alxion.com/>

(4) Torque at stall or low speed.

(5) Fluid input temperature should not be lower for avoiding condensation inside the motor.

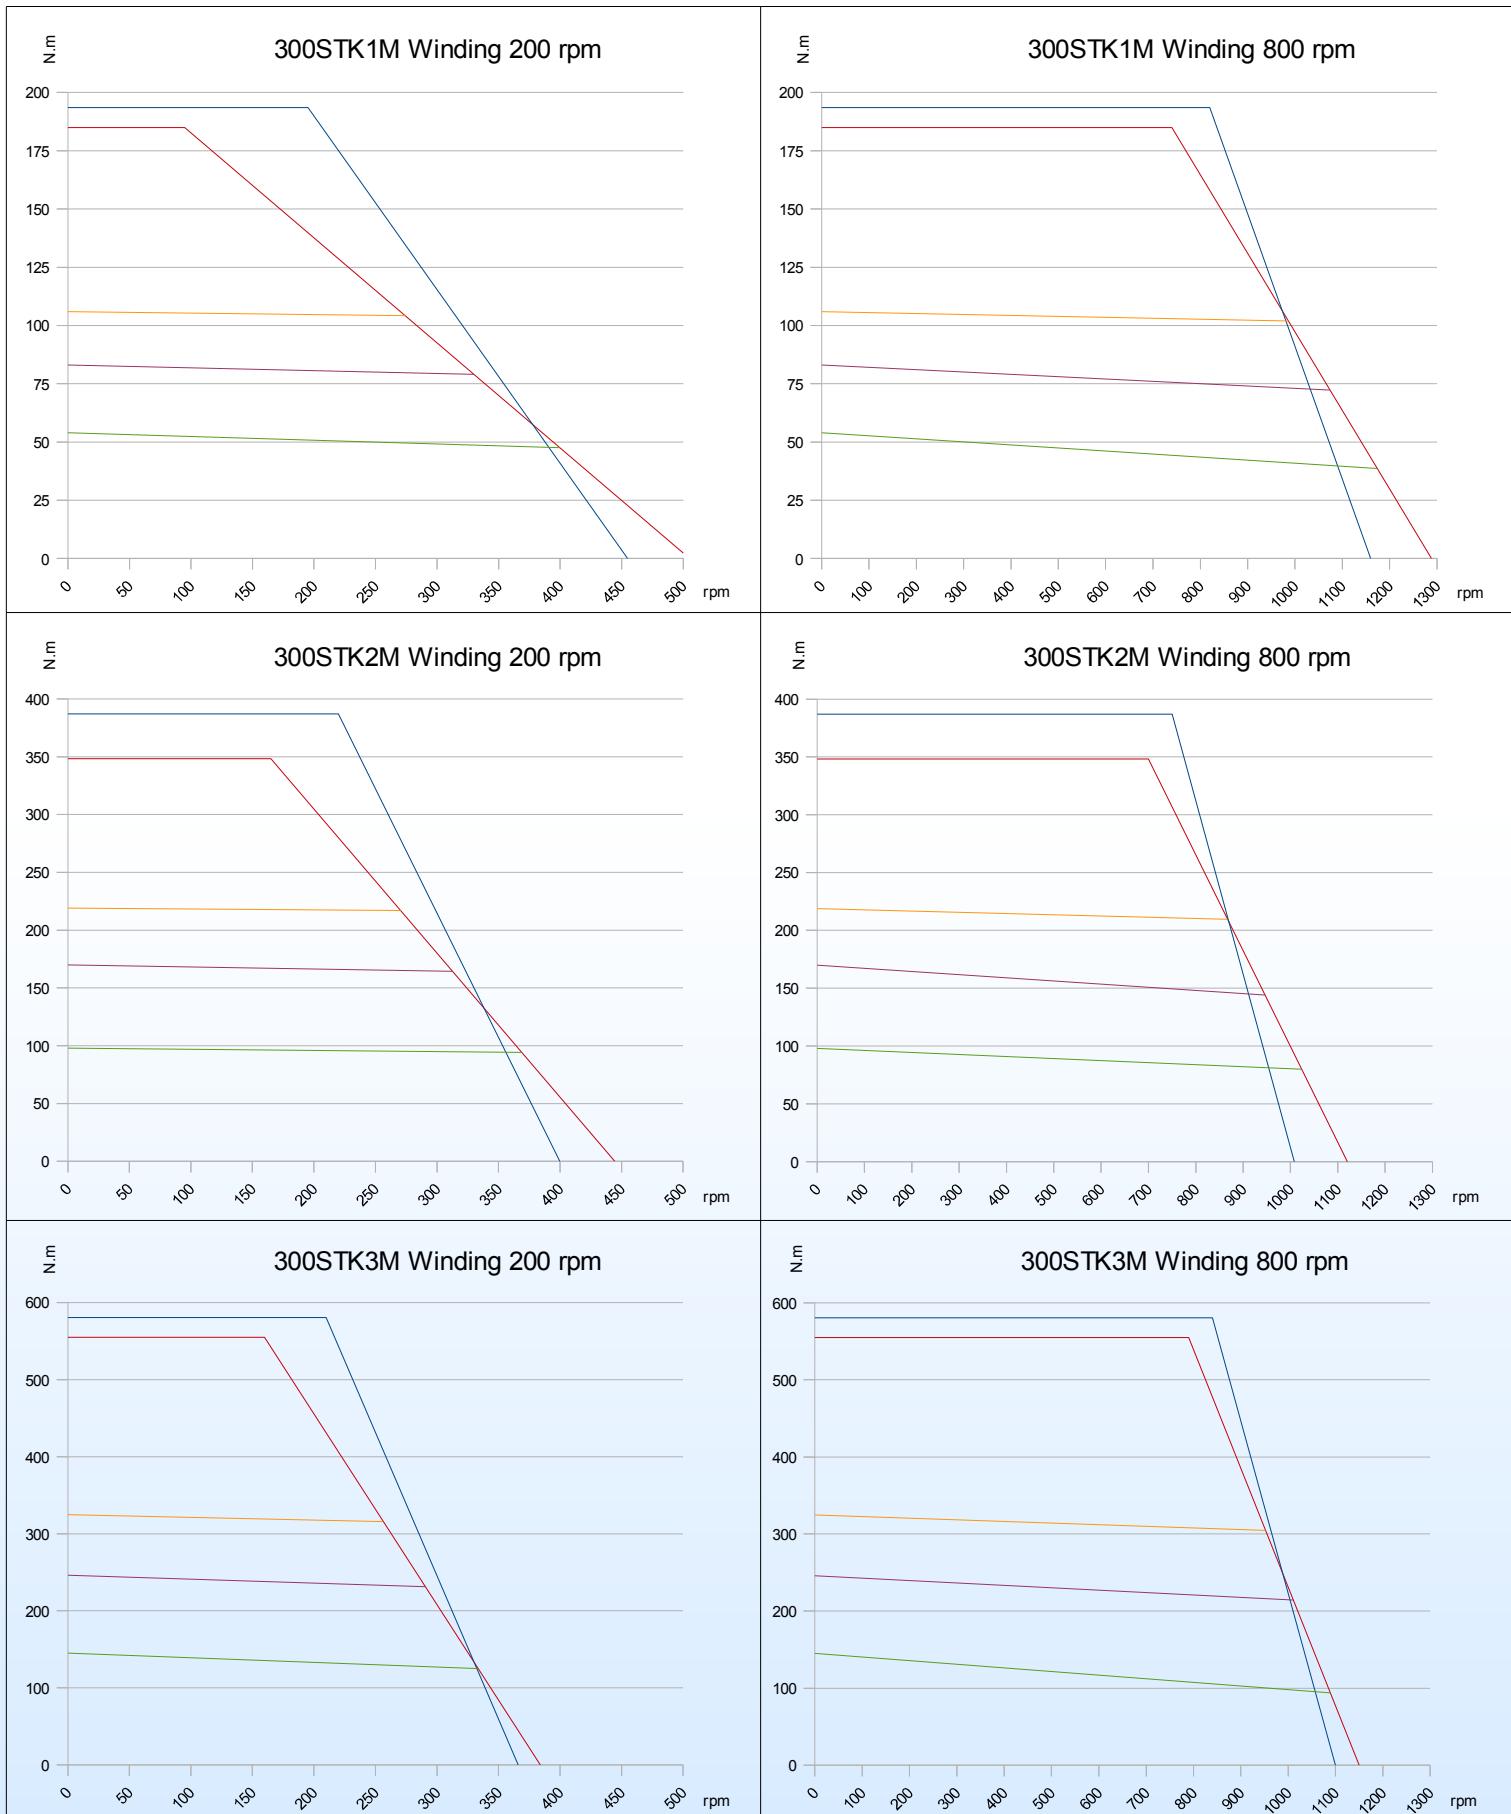

(6) For cooling fluid, use softened glycol-added water or fluids approved for closed cooling circuits.

(7) For currents lower than 38 Amps, one shielded cable

For currents over 38 Amps, four single shielded wires output (highlighted in the table)

Other speed characteristics are available, please contact us.

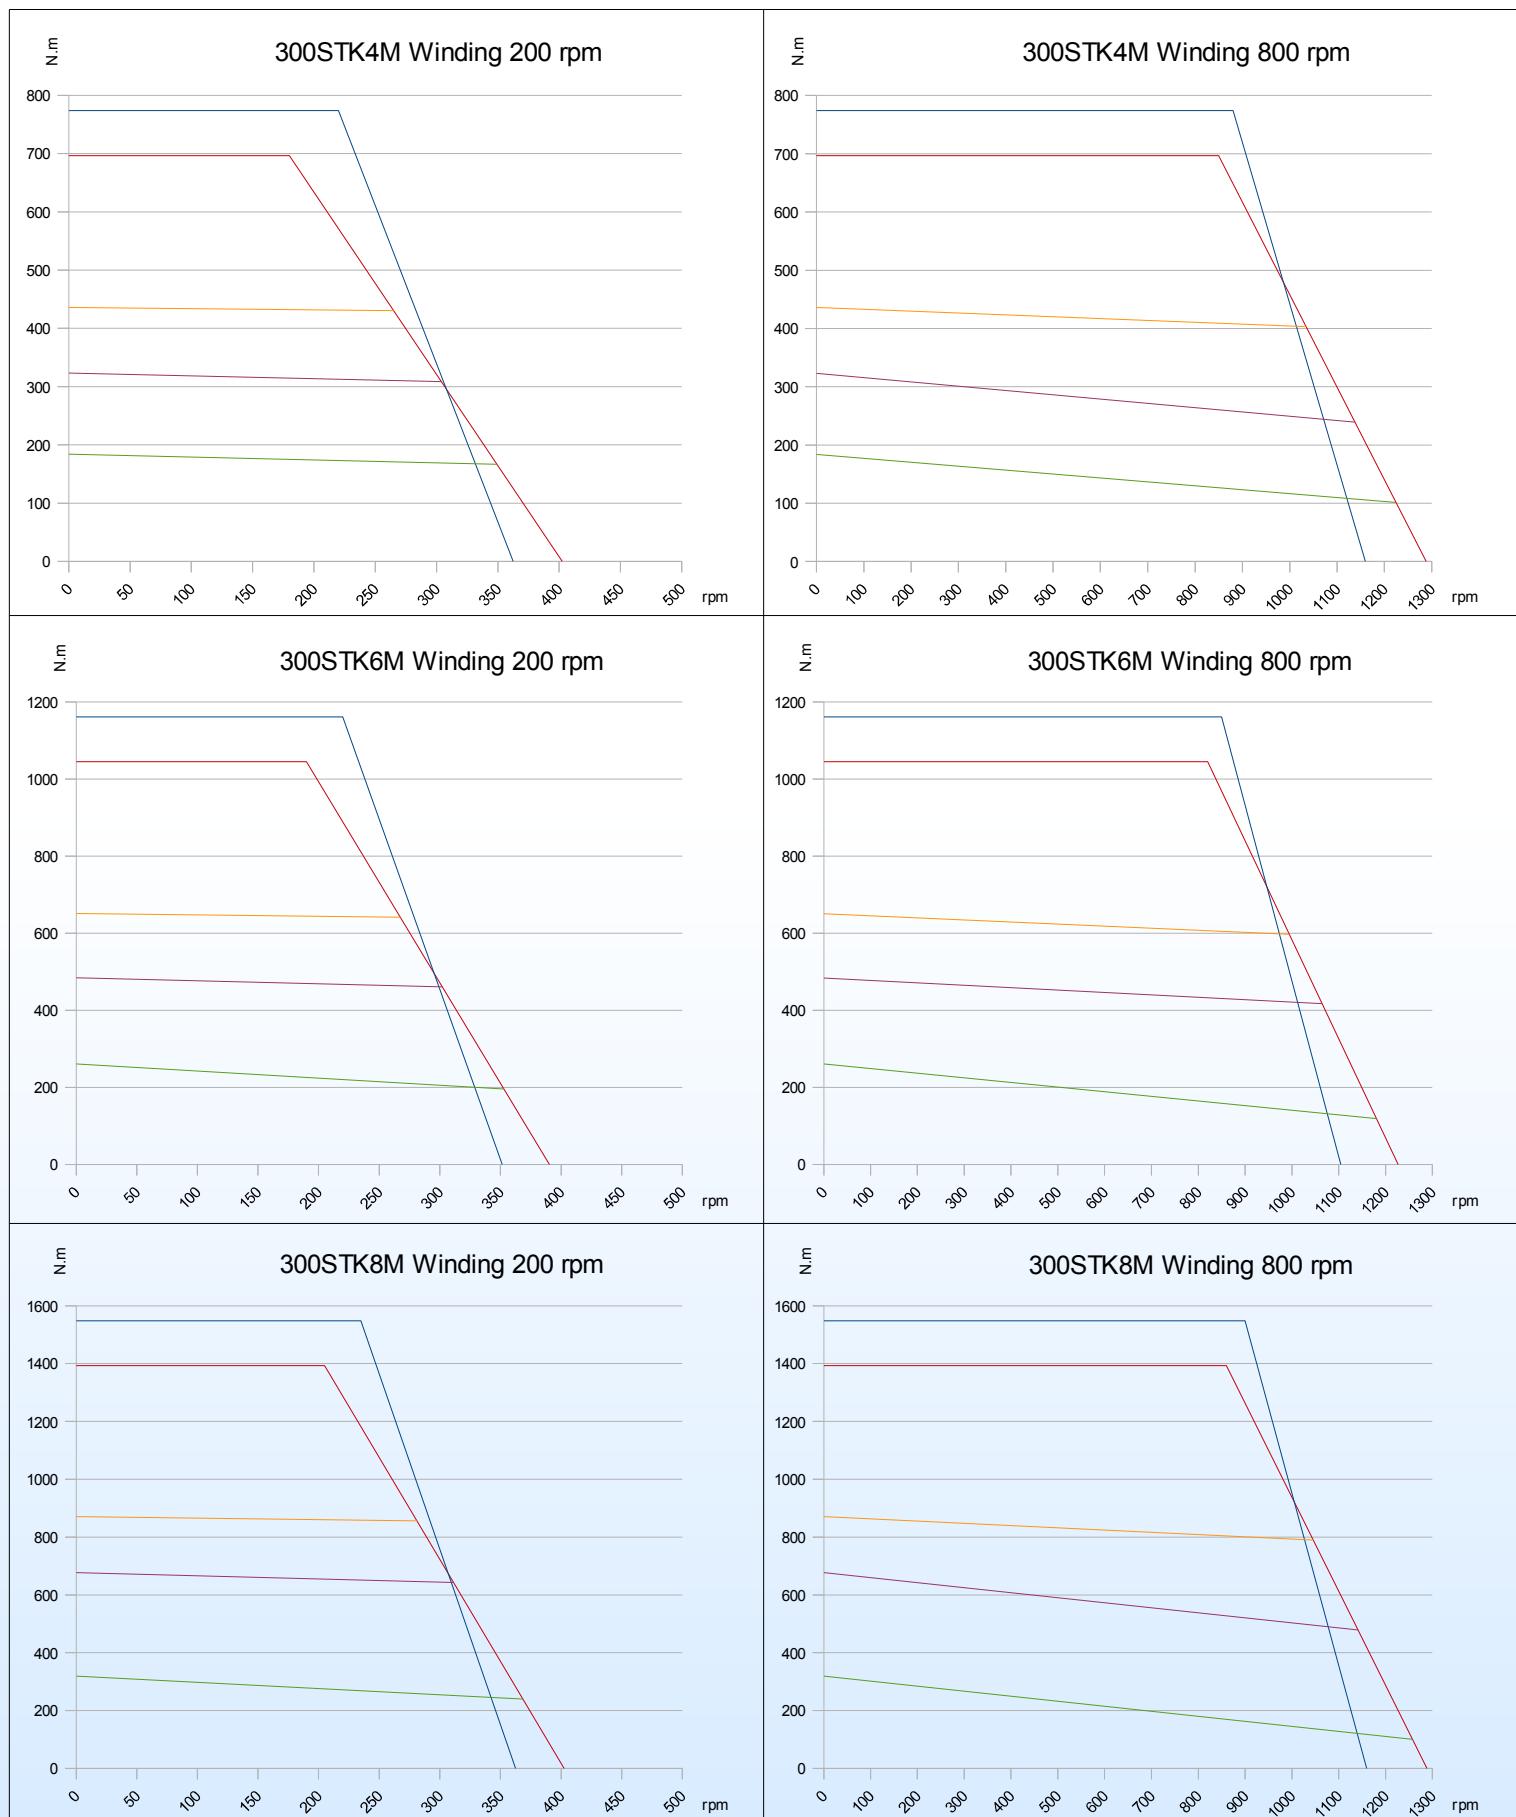

# TORQUE VS SPEED CURVES MOTORS 300STK

- Continuous torque with natural convection
- Continuous torque liquid cooled winding at 60°C
- Continuous torque liquid cooled winding at 140°C
- Max. transient characteristics motor at 20°C 400VAC mains / 540VDC bus with flux vector control
- Max. transient characteristics motor at rated temp 400VAC mains / 540VDC bus with flux vector control

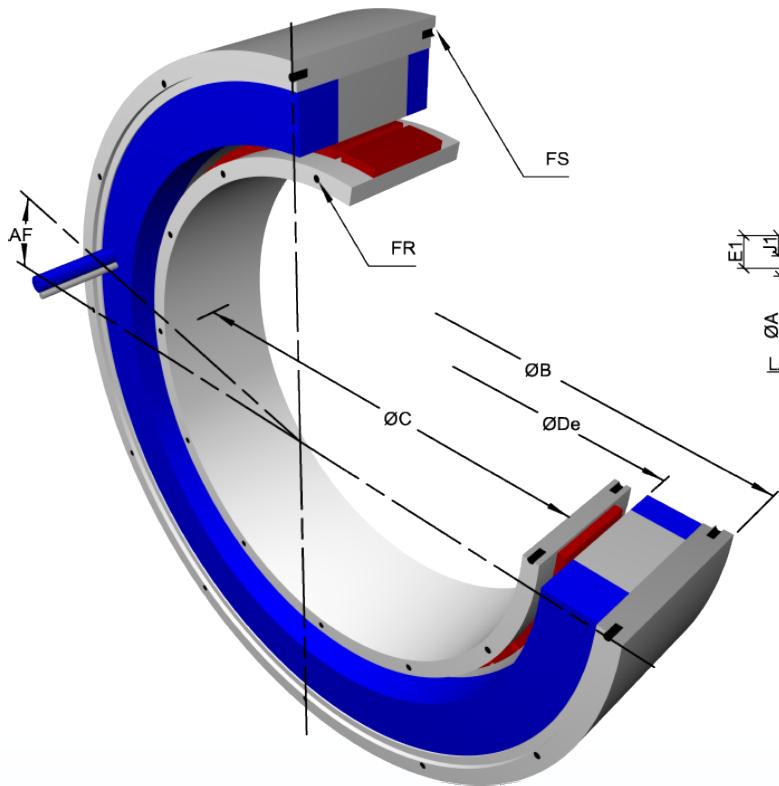

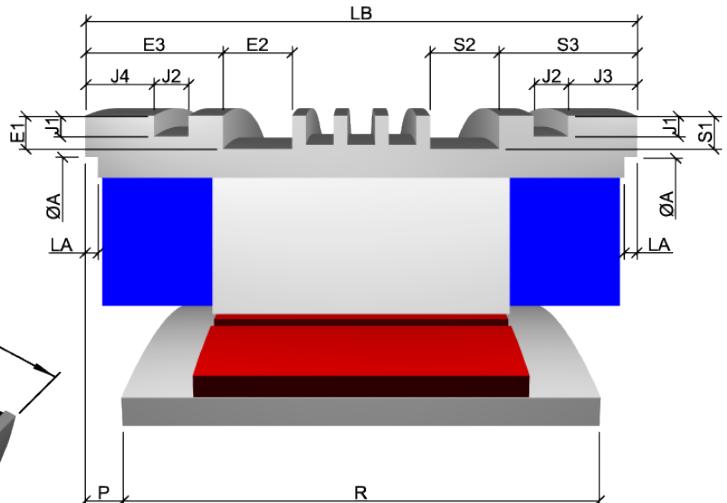

Other windings can be supplied for matching your needs ; please contact us.

Width of fluid rear I/O groove	S2	9.3
Position of fluid rear I/O groove	S3	27.2

**DIMENSIONS ACCORDING TO SIZE**

	400STK1M	400STK2M	400STK3M	400STK4M	400STK5M	400STK6M	400STK7M	400STK8M
Housing length	LB±0.15 (100.5) (130.5)	128 (158)	155.5 (185.5)	183 (213)	210.5 (240.5)	238 (268)	265.5 (295.5)	293 (323)
Rotor length	R +0.15	27.5	55	82.5	110	137.5	165	192.5

The dimensions in red in the table are valid in the case of a rated current greater than 53 A and class 6 shielded cable output

We also offer the possibility of not shielded output wires without need of stator length increase.

**INTEGRATION:**

- ✓ The cables are made of PU, class 6, foreseen for cable-bearing chains, 2 mt standard length, copper square section according rated current.
- ✓ Rotor / housing alignment (P) has to be executed within +/- 0.1 mm. Optionally, we can supply a mounting tool for achieving that alignment in case of assembly without possibility of accurate alignment.
- ✓ Thermal devices cable consists of 2 shielded pairs 2x2x0.25mm<sup>2</sup> section, 7 mm max external diameter.
- ✓ (De) represents:
  - 1- The maximum diameter passing inside the housing.
  - 2- The minimum diameter necessary for rotor assembly.
- ✓ (Pmax) diameter for pieces in contact with the rotor must never be exceeded.
- ✓ Tapped holes on each side of rotor and housing are angularly aligned.
- ✓ Cable positioning (AF) is theoretical. Leave a free room with a +/- 10 arc degrees tolerance around that position, on a 50 mm height from the housing side, for avoiding to stress the cables at the motor output.  
Do not tighten, twist or bend the power cable on the first 50 mm from motor side. Clamp the power cable after those 50 mm.
- ✓ When designing the assembly, take care to insure a perfect contact between housing and user's bore for avoiding thermal problems.
- ✓ For housing mounting, use either external centering diameter (B) or internal centering diameters (A).
- ✓ For execution tolerances (perpendicularity, concentricity..), please consult us.
- ✓ Fluid input and output pipes have to be placed at the opposite of wire outputs on the same axial plane.
- ✓ O-ring grooves designed for 4 mm diameter o-rings.

A full integration handbook can be supplied to our customers upon request

For further information or specific request about our motors, feel free to contact us.

(7) For currents lower than 53 Amps, one shielded cable

For currents over 53 Amps, four single shielded wires output (highlighted in the table)

Other speed characteristics are available, please contact us.

# TORQUE VS SPEED CURVES MOTORS 500STK

- Continuous torque with natural convection
- Continuous torque liquid cooled winding at 60°C
- Continuous torque liquid cooled winding at 140°C
- Max. transient characteristics motor at 20°C 400VAC mains / 540VDC bus with flux vector control
- Max. transient characteristics motor at rated temp 400VAC mains / 540VDC bus with flux vector control

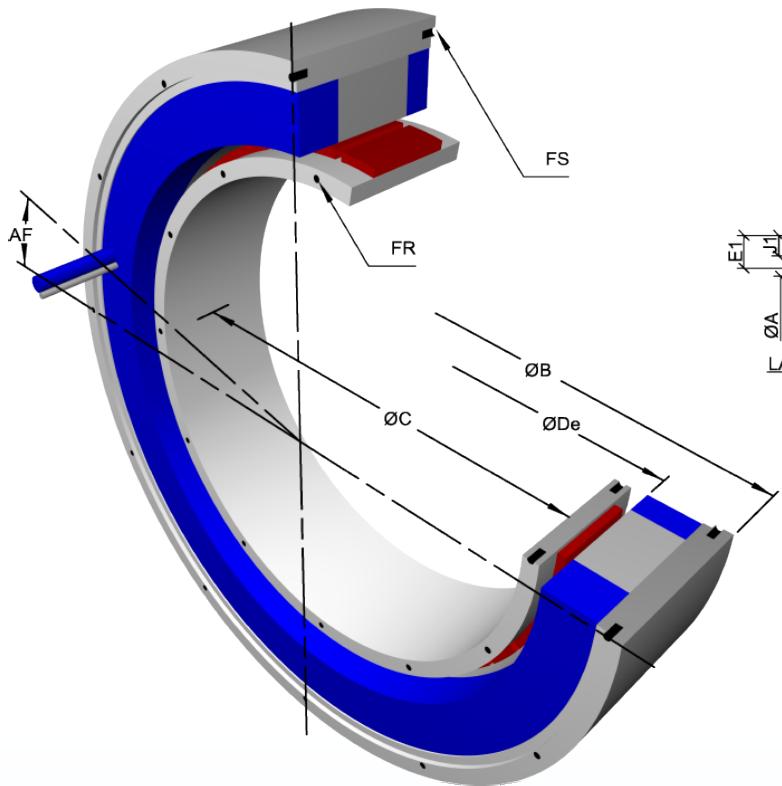

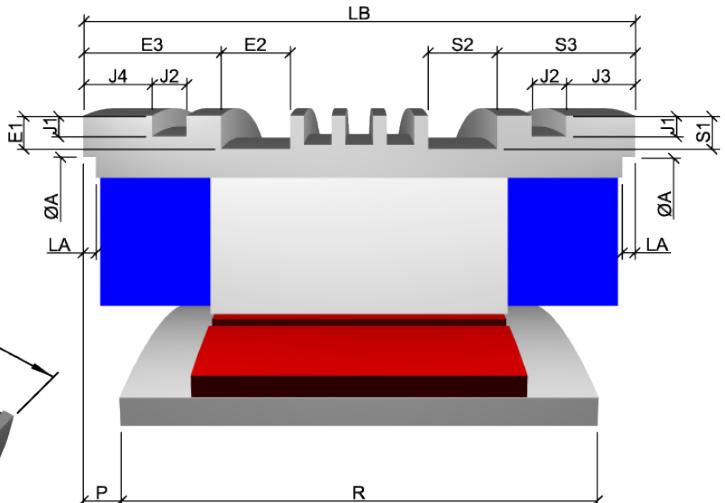

Other windings can be supplied for matching your needs ; please contact us.

# TORQUE VS SPEED CURVES MOTORS 500STK

- Continuous torque with natural convection
- Continuous torque liquid cooled winding at 60°C
- Continuous torque liquid cooled winding at 140°C
- Max. transient characteristics motor at 20°C 400VAC mains / 540VDC bus with flux vector control
- Max. transient characteristics motor at rated temp 400VAC mains / 540VDC bus with flux vector control

*Natural convection**Fluid cooling***DIMENSIONS FOR ALL 800 STK**

Housing internal centering diameter	A H8	762
Angle wire output / tapped holes	AF	11.25°
Housing external centering diameter (fluid cooling)	B f8	795
Housing external centering diameter (natural convection)	B f8	795
Rotoric internal centering diameter	C H7	630
Housing internal diameter	De	689
Depth of fluid front input / output groove	E1	8
Width of fluid front input / output groove	E2	15.5
Position of fluid front I/O groove	E3	28 (68)
Rotoric fixation holes	FR	16xM8 sur Ø645
Housing fixation holes	FS	16xM8 sur Ø774
O-ring groove depth	J1	4.9
O-ring groove width	J2	7.4
Position of rear o-ring groove	J3	13.7
Position of front o-ring groove	J4	15.7 (55.7)
Depth of housing internal centering diameter	LA	5
Alignment rotor / housing	P ± 0.2	47 (87)
Maximum rotoric contact diameter	Pmax	666
Depth of fluid rear I/O groove	S1	8
Width of fluid rear I/O groove	S2	15.5
Position of fluid rear I/O groove	S3	26

**DIMENSIONS ACCORDING TO SIZE**

	800STK1M	800STK2M	800STK4M	800STK6M
Housing length	LB±0.15 (152.5)	140 (180)	195 (235)	250 (290)
Rotor length	R +0.15	27.5	55	110

The dimensions in red in the table are valid in the case of a rated current greater than 53 A and class 6 shielded cable output

We also offer the possibility of not shielded output wires without need of stator length increase.

**INTEGRATION:**

- ✓ The cables are made of PU, class 6, foreseen for cable-bearing chains, 2 mt standard length, copper square section according rated current.
- ✓ Rotor / housing alignment (P) has to be executed within +/- 0.2 mm. Optionally, we can supply a mounting tool for achieving that alignment in case of assembly without possibility of accurate alignment.
- ✓ Thermal devices cable consists of 2 shielded pairs 2x2x0.25mm<sup>2</sup> section, 7 mm max external diameter.
- ✓ (De) represents:
  - 1- The maximum diameter passing inside the housing.
  - 2- The minimum diameter necessary for rotor assembly.
- ✓ (Pmax) diameter for pieces in contact with the rotor must never be exceeded.
- ✓ Tapped holes on each side of rotor and housing are angularly aligned.
- ✓ Cable positioning (AF) is theoretical. Leave a free room with a +/- 5 arc degrees tolerance around that position, on a 50 mm height from the housing side, for avoiding to stress the cables at the motor output.  
Do not tighten, twist or bend the power cable on the first 50 mm from motor side. Clamp the power cable after those 50 mm.
- ✓ When designing the assembly, take care to insure a perfect contact between housing and user's bore for avoiding thermal problems.
- ✓ For housing mounting, use either external centering diameter (B) or internal centering diameters (A).
- ✓ For execution tolerances (perpendicularity, concentricity..), please consult us.
- ✓ Fluid input and output pipes have to be placed at the opposite of wire outputs on the same axial plane.
- ✓ O-ring grooves designed for 6 mm diameter o-rings.

A full integration handbook can be supplied to our customers upon request

For further information or specific request about our motors, feel free to contact us.

# TECHNICAL CHARACTERISTICS

## Windings for 400V / 460Vac drives (See Application note)

			800STK1M		800STK2M		800STK4M		800STK6M	
NATURAL CONVECTION	Rated speed	rpm	30	250	30	250	30	250	30	-
	Continuous torque at stall	(1)(4) N.m	610		1127		2010		2708	-

(1) Thermal conditions:

Ambient temperature 20°C

Winding temperature rise 120°C

Stator housing in contact with the ambient air or integral on all its peripheral area with a metallic armature in contact with the ambient air.

Stator housing secured on a metallic frame having an area equal to twice the cross section of the housing.

(2) Cold motor at 20°C.

(3) See torque vs speed characteristics on :

<http://www.alxion.com/>

(4) Torque at stall or low speed.

(5) Fluid input temperature should not be lower for avoiding condensation inside the motor.

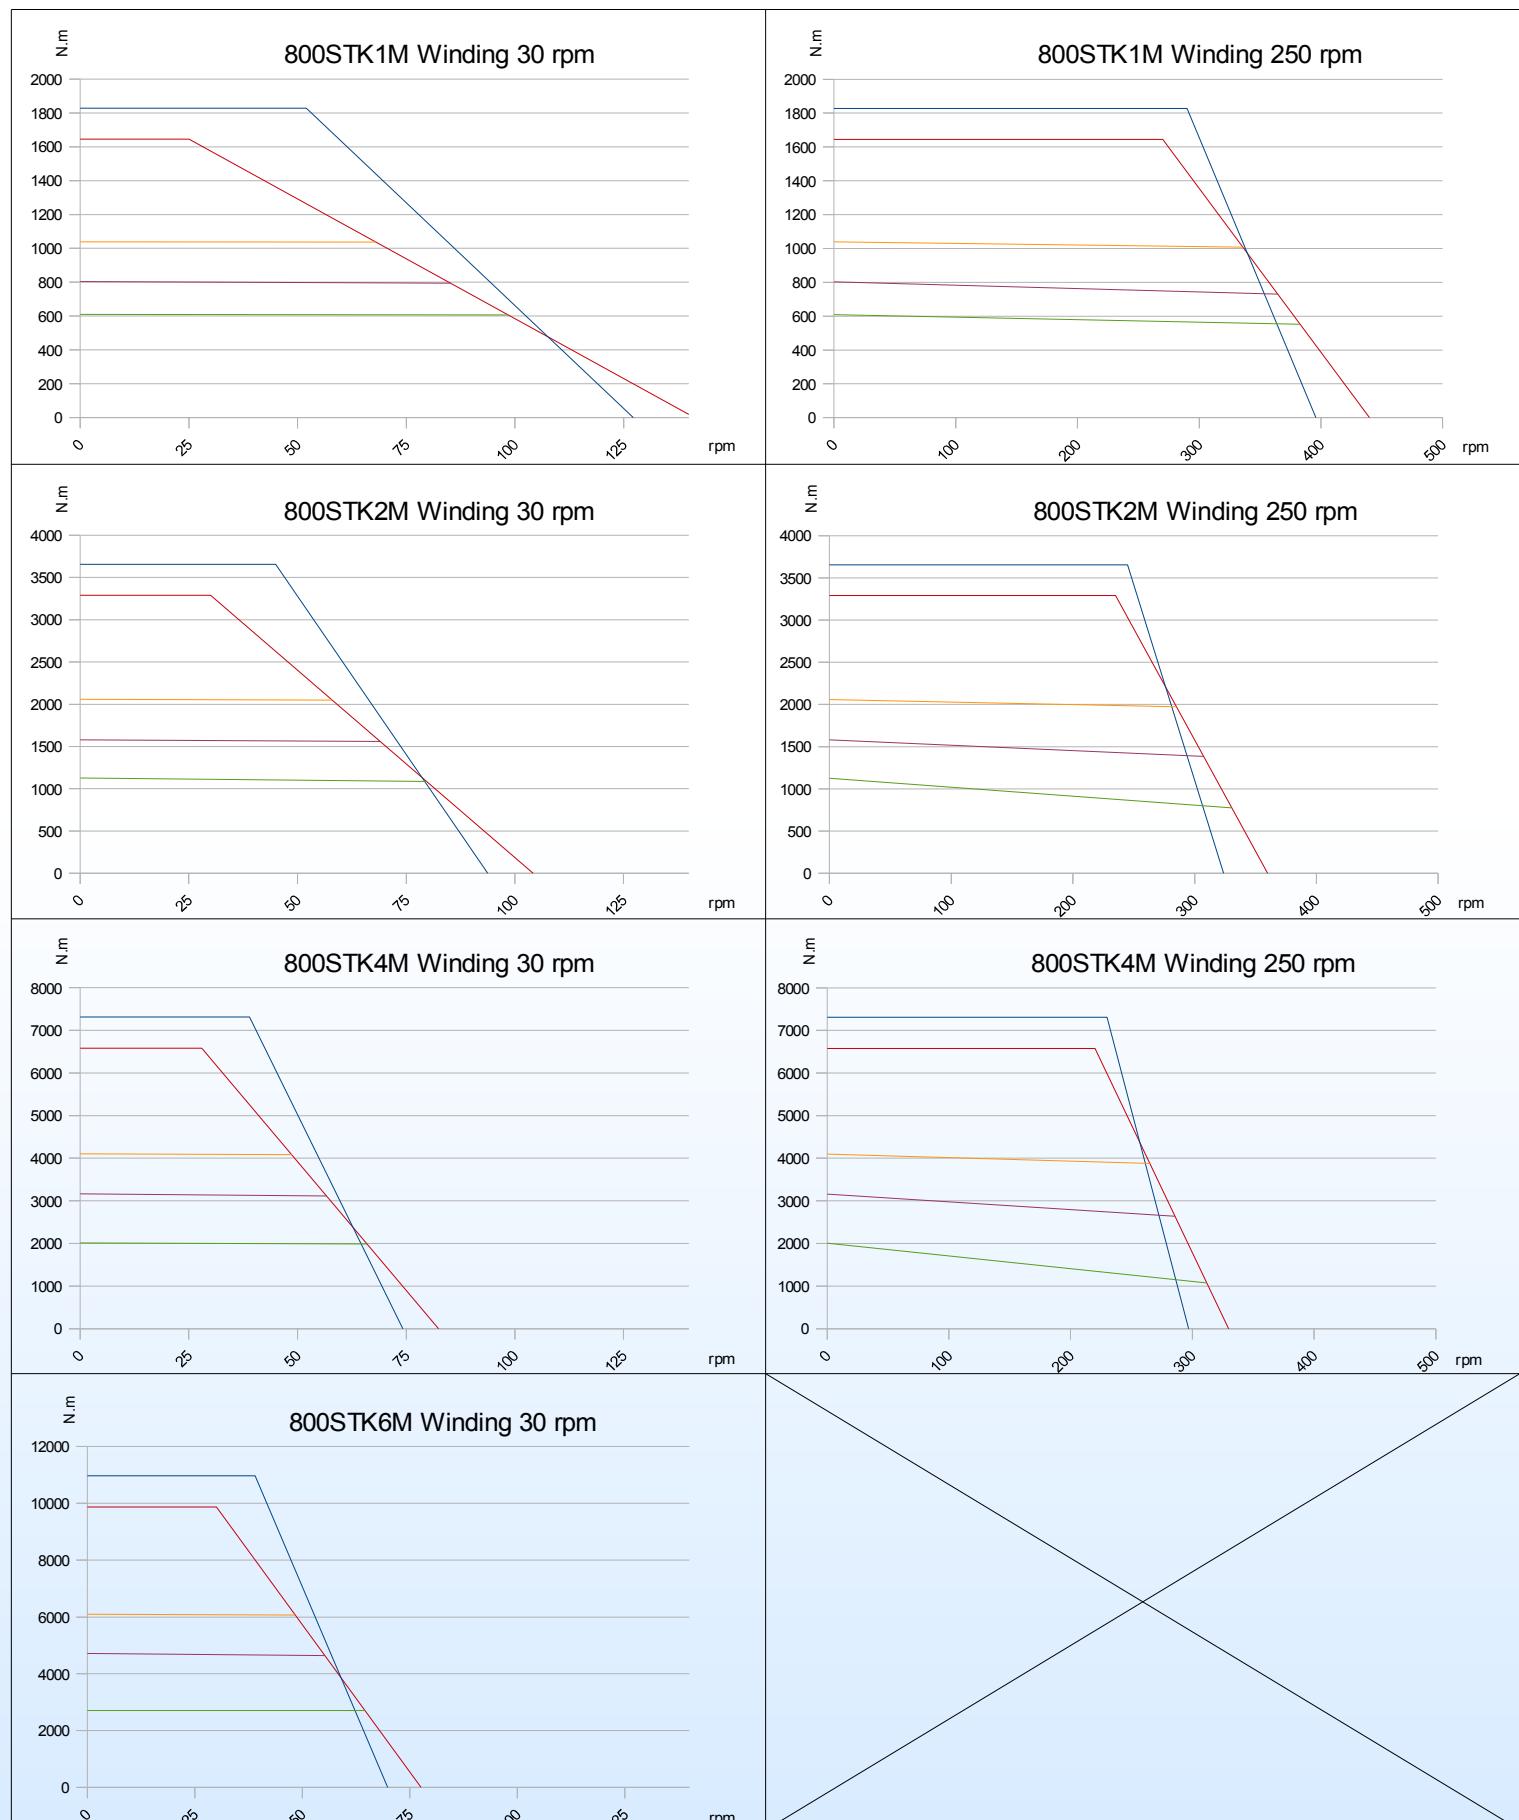

(6) For cooling fluid, use softened glycol-added water or fluids approved for closed cooling circuits.

(7) For currents lower than 53 Amps, one shielded cable

For currents over 53 Amps, four single shielded wires output (highlighted in the table)

Other speed characteristics are available, please contact us.

# TORQUE VS SPEED CURVES MOTORS 800STK

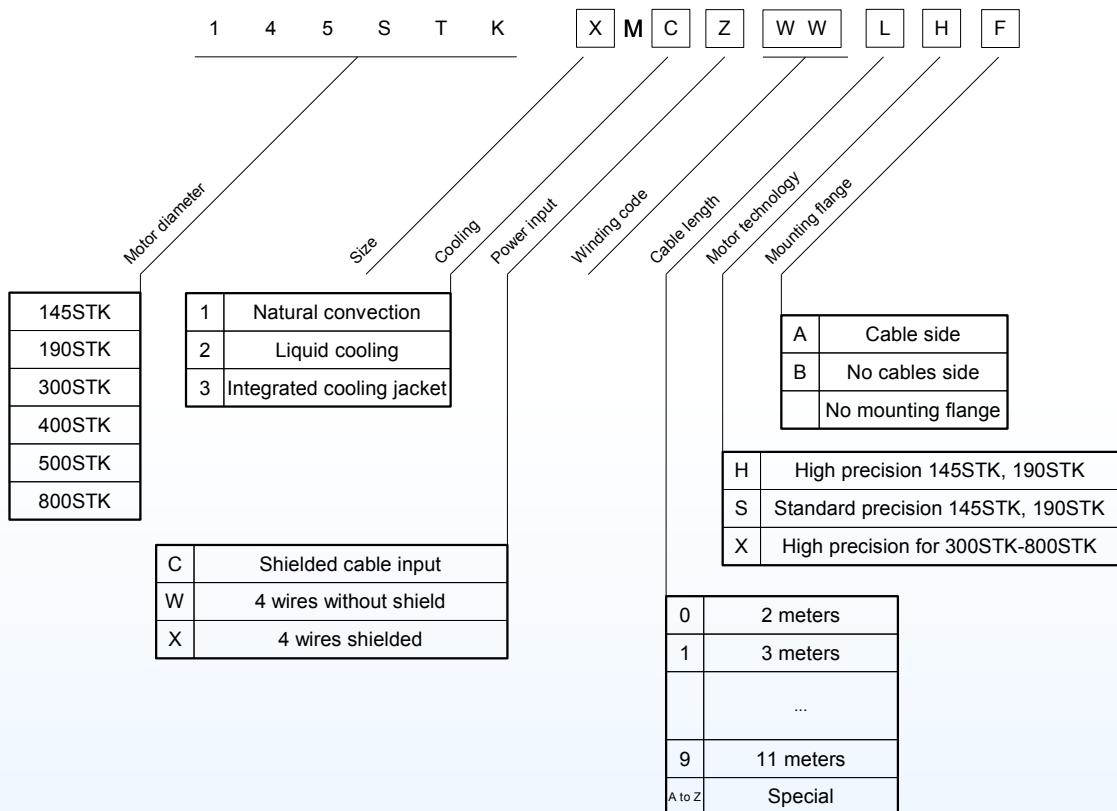

- Continuous torque with natural convection
- Continuous torque liquid cooled winding at 60°C
- Continuous torque liquid cooled winding at 140°C
- Max. transient characteristics motor at 20°C 400VAC mains / 540VDC bus with flux vector control
- Max. transient characteristics motor at rated temp 400VAC mains / 540VDC bus with flux vector control

Other windings can be supplied for matching your needs ; please contact us.

# CODIFICATION FOR STK MOTORS

C: Cooling:

- 1: Natural convection:  
Motor housing without cooling grooves
- 2: Liquid cooling:  
Motor housing with cooling grooves
- 3: Integrated cooling jacket:  
Motor with integrated cooling jacket (see table for dimensions)

W: Winding code:

- 01: Low speed in table of characteristics
- 02: High speed in table of characteristics
- XX: Special windings, contact us

H: Motor technology:

- H: High precision technology ; cogging <1% of rated torque in natural convection (145STK-190STK)
- S: Standard precision technology ; cogging ≤2% of rated torque in natural convection (145STK-190STK)
- X: High precision technology ; cogging <2% of rated torque in natural convection (300STK-800STK)

L: Cable length:

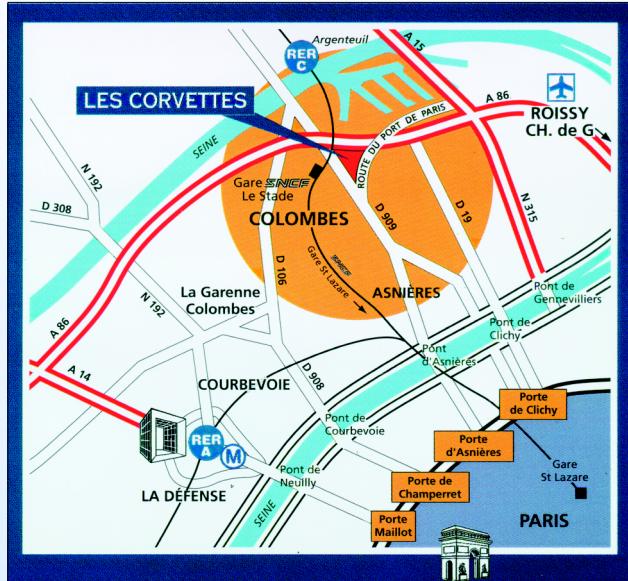

- 0 to 9 : Length since side of the motor
- A to Z : Length and/or specific square section
